

2019 IEEE International Conference on Communications (ICC)

Proceedings

**Shanghai, China
20 – 24 May 2019**

IEEE Catalog Number: CFP19ICC-ART
ISBN: 978-1-5386-8088-9
Online ISSN: 1938-1883

Reviewers

Mojtaba Aajami, Islamic Azad University, Zanjan Branch, Iran
Behnaam Aazhang, Rice University, USA
Ziaul Haq Abbas, GIK Institute of Engineering Sciences and Technology, Pakistan
Abdallah Abdallah, Penn State University, USA
Omar Abdel Wahab, Concordia University, Canada
Ahmed Abdelgawad, Central Michigan University, USA
Khaled Abdel-Ghaffar, University of California, USA
Sherin Abdelhamid, Queen's University, Canada
Ayman Abdel-Hamid, Arab Academy For Science, Technology, and Maritime Transport, Egypt
Ali Abedi, University of Maine, USA
Mohamed Abid, Al Akhawayn University, Morocco
Taufik Abrão, State University of Londrina, Brazil
Ahmad Abu Al Haija, University of Toronto, Canada
Najah Abu Ali, UAEU, United Arab Emirates
Ibrahim Abualhaol, Carleton University, Canada
Mervat Abu-Elkheir, The German University in Cairo, Egypt
Nof Abuzainab, Virginia Tech, USA
Koichi Adachi, The University of Electro-Communications, Japan
Ferran Adelantado, Universitat Oberta de Catalunya, Spain
Sasan Adibi, Deakin University, Australia
Nadine Adra, King Abdulaziz University, Saudi Arabia
Raviraj Adve, University of Toronto, Canada
Sofiene Affes, INRS-EMT, Canada
George Agapiou, Hellenic Telecommunications Organization, Greece
Nazim Agoulmine, University of Evry Val d'Essonne, USA
Dharma Agrawal, University of Cincinnati, USA
Ramon Aguero, University of Cantabria, Spain
Rui Aguiar, University of Aveiro, Portugal
Mónica Aguilar Igartua, Universitat Politècnica de Catalunya (UPC), Spain
Arslan Ahmad, University of Cagliari, Italy
Arman Ahmadzadeh, University of Erlangen-Nuremberg, Germany
Junaid Ahmed, COMSATS, United Kingdom (Great Britain)
Toufik Ahmed, CNRS-LaBRI UMR 5800, University Bordeaux, Bordeaux-INP, France
Syed Hassan Ahmed, Georgia Southern University, USA
Mohiuddin Ahmed, Canberra Institute of Technology, Australia
Qasim Ahmed, University of Huddersfield, United Kingdom (Great Britain)
Walid Ahmed, Broadcom Inc., USA
Jae Young Ahn, ETRI, Korea
Chunyu Ai, University of South Carolina Upstate, USA
Bo Ai, Beijing Jiaotong University, P.R. China
Adnan Aijaz, Toshiba Research Europe Ltd, United Kingdom (Great Britain)
Sonia Aïssa, INRS, University of Quebec, Canada
Abdeldjalil Aïssa-El-Bey, IMT Atlantique, France
Wessam Ajib, Université du Québec à Montréal, Canada
Marco Ajmone Marsan, Politecnico di Torino, Italy
Ozgur Akan, University of Cambridge, United Kingdom (Great Britain)
Sunila Akbar, NED University of Engineering and Technology, Pakistan
Mustafa Akbaş, Florida Polytechnic University, USA
Sami Akin, Leibniz Universität Hannover, Germany

Tugcan Aktas, Anketek Elektronik, USA
Ahmet Akyamac, Bell Labs, Nokia, USA
Ziad Al Abbasi, Middle Technical University, Iraq
Ali Al Ghouwayel, Lebanese International University, Lebanon
Obada Al Khatib, University of Wollongong Dubai, United Arab Emirates
Temitope Alade, University of Worcester, United Kingdom (Great Britain)
Fatih Alagoz, Bogazici University, Turkey
Ahmad AlAmmouri, University of Texas at Austin, USA
Michele Albano, CISTER/INESC-TEC, ISEP, Polytechnic Institute of Porto, Portugal
Ahmed Al-Dubai, Edinburgh Napier University, United Kingdom (Great Britain)
Anwer Al-Dulaimi, EXFO Inc., Canada
George Alexandropoulos, University of Athens, Greece
Fawaz AL-Hazemi, KAIST, Korea
Zain Ali, COMSATS Institute of Information Technology, Islamabad, Pakistan
Ahmed Alkhateeb, Arizona State University, USA
Ben Allen, University of Oxford, United Kingdom (Great Britain)
Osama Alluhaibi, University of Warwick, United Kingdom (Great Britain)
Kevin Almeroth, University of California, Santa Barbara, USA
Jalal Almhana, Universite de Moncton, Canada
Mohammed Almulla, Kuwait University, Kuwait
Gianluca Aloï, University of Calabria, Italy
Jesus Alonso-Zarate, Centre Tecnologic de Telecomunicacions de Catalunya - CTTC, Spain
Mohamed-Slim Alouini, King Abdullah University of Science and Technology (KAUST), Saudi Arabia
Saud Althunibat, Al-Hussein Bin Talal University, Jordan
Onur Altintas, Toyota InfoTechnology Center, USA, Inc., USA
Hanan Al-Tous, United Arab Emirates University, United Arab Emirates
Hirley Alves, University of Oulu, Finland
Luis Alves, DETI, Universidade of Aveiro, Instituto de Telecomunicações, Portugal
Mário Alves, Politécnico do Porto, Portugal
David Amanor, Intel Corporation, USA
Gayan Amarasuriya, Southern Illinois University, USA
Paolo Amato, Micron, Italy
Osama Amin, King Abdullah University of Science and Technology (KAUST), Saudi Arabia
Habib M. Ammari, Fordham University, USA
SaiDhiraj Amuru, IIT Hyderabad, India
Min Kyung An, Sam Houston State University, USA
Wei An, Institute of Information Engineering, Chinese Academy of Sciences, P.R. China
Santhanakrishnan Anand, New York Institute of Technology, USA
Rajoua Anane, Laboratory of Acoustics at University of Maine, LAUM, France
Christopher Anderson, United States Naval Academy, USA
Sergey Andreev, Tampere University of Technology, Finland
Sergey Andreev, Tampere University of Technology, Finland
Constantinos Marios Angelopoulos, Bournemouth University, United Kingdom (Great Britain)
Imran Shafique Ansari, University of Glasgow, United Kingdom (Great Britain)
Angelos Antonopoulos, Telecommunications Technological Centre of Catalonia (CTTC), Spain
Khoirul Anwar, Telkom University, Indonesia
Ramon Aparicio-Pardo, Université Côte d'Azur, France
Ahmed Arafa, Princeton University, USA
Giuseppe Araniti, University Mediterranea of Reggio Calabria, Italy
Masoud Ardakani, University of Alberta, Canada
Omid Ardakanian, University of Alberta, Canada
Loredana Arienzo, University of Bologna, Department of Electrical, Electronic and Information Engineering, Italy

Suayb Arslan, MEF University, Turkey
Takuya Asaka, Tokyo Metropolitan University, Japan
Gerd Ascheid, RWTH Aachen University, Germany
Mohamad Assaad, CentraleSupélec, France
Chadi Assi, Concordia University, Canada
Saman Atapattu, University of Melbourne, Australia
Italo Atzeni, EURECOM, France
Edward Au, Huawei Technologies Co., Ltd., Canada
Gagangeet Aujla, Chandigarh University, Mohali (Punjab), India
Jocelyn Aulin, Huawei Technologies Sweden AB, Sweden
Stefano Avallone, University of Naples, Italy
Marwane Ayaida, University of Reims Champagne-Ardenne, France
Amin Azari, KTH Royal Institute of Technology, Sweden
Muhammad Reza Kahar Aziz, Institut Teknologi Sumatera, Indonesia
Péter Babarczi, Budapest University of Technology and Economics, Hungary
Fulvio Babich, University of Trieste, Italy
Abdelmalik Bachir, Biskra University, Algeria
Venkataramana Badarla, Indian Institute of Technology Tirupati, India
Osamah Badarneh, German Jordanian University, Jordan
Kareem Baddour, Communications Research Centre Canada, Canada
Leonardo Badia, Università degli Studi di Padova, Italy
Hakim Badis, UPEM, France
Mihai-Alin Badiu, University of Oxford, United Kingdom (Great Britain)
Sangkyu Baek, Samsung Research, Korea
Saewoong Bahk, Seoul National University, Korea
Shahab Bahrami, University of British Columbia, Canada
Bo Bai, Huawei Technologies Co., Ltd., Hong Kong
Tianyang Bai, Qualcomm, USA
Lin Bai, Beihang University, P.R. China
Zhiqun Bai, Shandong University, P.R. China
Mohammed Baidas, Kuwait University, Kuwait
Corey Baker, University of Kentucky, USA
Erdem Bala, InterDigital, USA
Indika Balapuwaduge, University of Agder, Norway
Marco Baldi, Università Politecnica delle Marche, Italy
Masaki Bandai, Sophia University, Japan
Adrish Banerjee, Indian Institute of Technology, Kanpur, India
Omar Banimelhem, Jordan University of Science and Technology, Jordan
Vo Nguyen Quoc Bao, Posts and Telecommunications Institute of Technology, Vietnam
Alcardo Barakabitze, University of Plymouth, United Kingdom (Great Britain)
Ataul Bari, University of Western Ontario, Canada
Lina Bariah, Khalifa University, United Arab Emirates
Nabajeet Barman, Kingston University, United Kingdom (Great Britain)
Novella Bartolini, Sapienza University of Rome, Italy
Stylianos Basagiannis, United Technologies Research Centre, Ireland
Stefano Basagni, Northeastern University, USA
Ertugrul Basar, Koc University, Turkey
Joaquim Bastos, Instituto de Telecomunicações, Portugal
Gerhard Bauch, Hamburg University of Technology, Germany
Martin Bauer, NEC Europe Ltd., Germany
Norman Beaulieu, Beijing University of Posts and Telecommunications BUPT, P.R. China
Ebrahim Bedeer, Ulster University, United Kingdom (Great Britain)

Baltasar Beferull-Lozano, University of Agder, Norway
Hamid Behrooz, Sharif University of Technology, Iran
Bassel Beidas, Hughes, USA
Tarek Bejaoui, University of Paris-Sud 11, Tunisia
Paolo Bellavista, University of Bologna, Italy
Benjamin Belzer, Washington State University, USA
Yann Ben Maissa, INPT, Morocco
Mohammed Benaissa, University of Sheffield, United Kingdom (Great Britain)
Nabil Benamar, Moulay Ismail University, Morocco
Salima Benbernou, Paris Descartes, France
Fatma Benkhalifa, Imperial College London, United Kingdom (Great Britain)
Mehdi Bennis, Centre of Wireless Communications, University of Oulu, Finland
Jalel Ben-Othman, CentraleSupélec & University of Paris 13, France
Brahim Bensaou, The Hong Kong University of Science and Technology, Hong Kong
Abderrahim Benslimane, University of Avignon, France
Kostas Berberidis, University of Patras, Greece
Ana Bernardos, Universidad Politecnica de Madrid, Spain
Randall Berry, Northwestern University, USA
Christian Bettstetter, University of Klagenfurt, Austria
André-Luc Beylot, University of Toulouse, France
Bruhadeshwar Bezawada, Mahindra Ecole Centrale, India
B Bharathi, Anna University, India
Srikrishna Bhashyam, Indian Institute of Technology Madras, India
Manav Bhatnagar, Indian Institute of Technology Delhi, India
Aniruddha Bhattacharjya, Tsinghua University, P.R. China
Amiya Bhattacharya, University at Albany, USA
Md Zakirul Alam Bhuiyan, Fordham University, USA
Yuanguo Bi, Northeastern University, P.R. China
Suzhi Bi, Shenzhen University, P.R. China
Kaigui Bian, Peking University, P.R. China
Giuseppe Bianchi, University of Rome "Tor Vergata", Italy
Andrea Bianco, Politecnico di Torino, Italy
Guo Bin, Northwestern Polytechnical University, P.R. China
Igor Bisio, University of Genoa, Italy
Salim Bitam, University of Biskra, Algeria
Emil Björnson, Linköping University, Sweden
Aggelos Bletsas, Technical University of Crete, Greece
Aggelos Bletsas, Massachusetts Institute of Technology, USA
Steven Blostein, Queen's University, Canada
Rick Blum, Lehigh University, USA
Fernando Boavida, University of Coimbra, Portugal
Mate Boban, Huawei German Research Center, Germany
Mathias Boc, CEA, LIST, Communicating Systems Laboratory, France
Federico Boccardi, Ofcom, United Kingdom (Great Britain)
Mohammud Bocus, Toshiba Research Europe Ltd, United Kingdom (Great Britain)
Gennaro Boggia, Politecnico di Bari, Italy
Ladislau Bölöni, University of Central Florida, USA
Andrea Bonfante, Nokia Bell Labs Ireland, Ireland
Amnart Boonkajay, Tohoku University, Japan
Roksana Boreli, Anonalytix, Australia
Eleonora Borgia, IIT-CNR, Italy
Wuyunzhaola Borjigin, Muroran Institute of Technology, Japan

Rodrigo Bortoletto, São Paulo Federal Institute of Education, Science and Technology, Brazil
Alessio Botta, University of Napoli Federico II, Italy
Larbi Boubchir, University of Paris 8, France
Mohamed Boucadair, Orange, France
Chérifa Boucetta, University Paris Descartes, France
Mathieu Bouet, Thales, France
Leila Boulahia, University of Technology of Troyes, France
Selma Boumerdassi, Conservatoire National des Arts et Métiers, France
Alexandra Bousia, Universitat Politècnica de Catalunya (UPC), Spain
Khaled Boussetta, University of Paris 13, France
Liu Boyang, Xi'an University of Posts and Telecommunications, P.R. China
David Boyle, Imperial College London, United Kingdom (Great Britain)
Torsten Braun, University of Bern, Switzerland
José Marcos Brito, Inatel, Brazil
Raffaele Bruno, IIT-CNR, Italy
Matthias Brust, University of Luxembourg, Luxembourg
Eyuphan Bulut, Virginia Commonwealth University, USA
Chiara Buratti, University of Bologna, Italy
Alister Burr, University of York, United Kingdom (Great Britain)
Leandro Buss Becker, Federal University of Santa Catarina, Brazil
M. Majid Butt, Nokia Bell Labs, France
Stefano Buzzi, University of Cassino and Lazio Meridionale/CNIT, Italy
Lin Cai, University of Victoria, Canada
Lin Cai, Illinois Institute of Technology, USA
Yu Cai, Michigan Technological University, USA
Wenlong Cai, Beijing Aerospace Automatic Control Institute, P.R. China
Kui Cai, Singapore University of Technology and Design, Singapore
Yunlong Cai, Zhejiang University, P.R. China
Jun Cai, Concordia University, Canada
Carlo Caini, University of Bologna, Italy
Giuseppe Caire, Technische Universität Berlin, Germany
Daniel Calabuig, Universitat Politècnica de València, Spain
Carlos Calafate, Universidad Politécnica de Valencia, Spain
Christian Callegari, RaSS National Laboratory - CNIT, Italy
Franco Callegati, Università di Bologna, Italy
Prasad Calyam, University of Missouri-Columbia, USA
Hasan Cam, Army Research Laboratory, USA
Miguel Elias Mitre Campista, Federal University of Rio de Janeiro, Brazil
Claudia Campolo, University Mediterranea of Reggio Calabria, Italy
Berk Canberk, Istanbul Technical University, Turkey
Hakki Cankaya, Fujitsu Network Communications, USA
Juan-Carlos Cano, Universidad Politécnica de Valencia, Spain
Bin Cao, Harbin Institute of Technology Shenzhen Graduate School, P.R. China
Lei Cao, The University of Mississippi, USA
Xianghui Cao, Southeast University, P.R. China
Haotong Cao, Nanjing University of Posts and Telecommunications, P.R. China
Yang Cao, Huazhong University of Science and Technology, P.R. China
Pan Cao, University of Hertfordshire, United Kingdom (Great Britain)
Leonardo Cardoso, Université de Lyon, France
Kleber Cardoso, Universidade Federal de Goiás, Brazil
Estela Carmona Cejudo, University of Kent, United Kingdom (Great Britain)
Glaucio Carvalho, Ryerson University, Canada

Marcelo Carvalho, University of Brasília, Brazil
Augusto Casaca, INESC-ID, Portugal
Vicente Casares-Giner, Universitat Politècnica de València, Spain
Marco Casazza, Università degli Studi di Milano, Italy
Carmelo Cascone, Open Networking Foundation, USA
Giuseppe Caso, Simula Metropolitan Center for Digital Engineering, Norway
Dajana Cassioli, University of L'Aquila, Italy
Aniello Castiglione, University of Naples Parthenope, Italy
Cicek Cavdar, KTH Royal Institute of Technology, Sweden
Luca Caviglione, National Research Council (CNR), Italy
Hasari Celebi, Gebze Technical University, Turkey
Abdulkadir Celik, KAUST, Saudi Arabia
Walter Cerroni, University of Bologna, Italy
Isabella Cerutti, Nokia, Italy
Alberto Ceselli, Università degli Studi di Milano, Italy
Sandra Céspedes, Universidad de Chile, Chile
Oktay Cetinkaya, University of Southampton, United Kingdom (Great Britain)
Anas Chaaban, University of British Columbia, Canada
Chan-Byoung Chae, Yonsei University, Korea
Seong Ho Chae, Korea Polytechnic University, Korea
Marwa Chafii, ENSEA, France
Tijani Chahed, Telecom SudParis, France
Rong Chai, Chongqing University of Posts and Telecommunications, P.R. China
Wei Koong Chai, Bournemouth University, United Kingdom (Great Britain)
Zhenchuan Chai, F5 Networks, USA
Batu Chalise, New York Institute of Technology, USA
Yacine Challal, University of Technology of Compiègne, France
Jean-Francois Chamberland, Texas A&M University, USA
Benoit Champagne, McGill University, Canada
Sammy Chan, City University of Hong Kong, Hong Kong
Calvin C K Chan, The Chinese University of Hong Kong, Hong Kong
Yusun Chang, Kennesaw State University, USA
Hong-Yi Chang, National Chiayi University, Taiwan
Zheng Chang, University of Jyväskylä, Finland
Ronald Chang, Academia Sinica, Taiwan
Hakima Chaouchi, Telecom Sud Paris-Institut Mines Telecom, France
Bruno Chatras, Orange Labs, France
Bijoy Chatterjee, South Asian University, India
Ioannis Chatzigiannakis, Sapienza University of Rome, Italy
Periklis Chatzimisios, Alexander TEI of Thessaloniki and Bournemouth University, Greece
Symeon Chatzinotas, University of Luxembourg, Luxembourg
Dimitris Chatzopoulos, Hong Kong University of Science and Technology, Hong Kong
Prosper Chemouil, Orange Labs (retired), France
Hui Chen, CUNY Brooklyn College, USA
Ing-Ray Chen, Virginia Tech, USA
Lin Chen, The University of Paris-Sud, France
Ling-Jyh Chen, Academia Sinica, Taiwan
Wei-Peng Chen, Fujitsu Laboratories of America, USA
Yan Chen, University of Electronic Science and Technology of China, P.R. China
Yuanzhu Chen, Memorial University of Newfoundland, Canada
Yuh-Shyan Chen, National Taipei University, Taiwan
Hongyang Chen, Fujitsu Laboratories Limited, Japan

Jia Chen, Beijing Jiaotong University, P.R. China
Lei Chen, Georgia Southern University, USA
Yue Chen, Queen Mary University of London, United Kingdom (Great Britain)
Bo Chen, Michigan Technological University, USA
Thomas Chen, City University London, United Kingdom (Great Britain)
Yingying Chen, Rutgers University, USA
Zhong Chen, School of Electronics Engineering and Computer Science, Peking University, P.R. China
Chung Shue Chen, Bell Labs, Nokia, France
Kang Chen, Southern Illinois University Carbondale, USA
Xiangqian Chen, Florida International University, USA
Yu Chen, Binghamton University, USA
Gaojie Chen, University of Leicester, United Kingdom (Great Britain)
Riqing Chen, Fujian Agriculture and Forestry University, P.R. China
Qingchun Chen, Guangzhou University, P.R. China
Biao Chen, University of Macau, Macao
Qimei Chen, Wuhan University, P.R. China
Siguang Chen, Nanjing University of Posts and Telecommunications, P.R. China
Xiang Chen, Sun Yat-sen University, P.R. China
Xinlei Chen, Carnegie Mellon University, USA
Zesheng Chen, Purdue University Fort Wayne, USA
Longbiao Chen, Xiamen University, P.R. China
Bin Chen, Shenzhen University, P.R. China
Bowen Chen, School of Electronic and Information Engineering, Soochow University, P.R. China
Jiajia Chen, KTH Royal Institute of Technology, Sweden
Jiaqi Chen, Huazhong University of Science and Technology, P.R. China
Jinyuan Chen, Louisiana Tech University, USA
Mu-Song Chen, Electrical Engineering, Da-Yeh University, Taiwan
Runhua Chen, China Academy of Telecommunications Technology, USA
Chen Chen, Argonne National Laboratory, USA
Lijun Chen, University of Colorado at Boulder, USA
Pin-Yu Chen, AI Foundations, IBM T. J. Watson Research Center, USA
Yang Chen, Fudan University, P.R. China
Zhiyong Chen, Shanghai Jiao Tong University, P.R. China
Dajiang Chen, University of Electronic Science and Technology of China, P.R. China
Mingzhe Chen, Beijing University of Posts and Telecommunications, P.R. China
Wen Chen, Shanghai Jiao Tong University, P.R. China
Xi Chen, Virginia Tech, USA
Yaw-Chung Chen, National Chiao Tung University, Taiwan
Yunfei Chen, University of Warwick, United Kingdom (Great Britain)
Zheng Chen, Linköping University, Sweden
Yejian Chen, Bell Laboratories, Nokia, Germany
Wei Chen, Tsinghua University, P.R. China
Maggie Cheng, Illinois Institute of Technology, USA
Peng Cheng, Zhejiang University, P.R. China
Yu Cheng, Illinois Institute of Technology, USA
Shin-Ming Cheng, National Taiwan University of Science and Technology, Taiwan
Xiantao Cheng, University of Electronic Science and Technology of China, P.R. China
Bo Cheng, Beijing University of Posts & Telecommunications, P.R. China
Nan Cheng, University of Waterloo, Canada
Peng Cheng, The University of Sydney, Australia
Guang Cheng, Southeast University, P.R. China
Soumaya Cherkaoui, Université de Sherbrooke, Canada

Sylvain Cherrier, Université Paris-Est, France
Stefano Chessa, Università di Pisa, Italy
Pascal Chevalier, CNAM, France
Kaikai Chi, Zhejiang University of Technology, P.R. China
Nan Chi, Fudan University, P.R. China
Chong-Yung Chi, National Tsing Hua University, Taiwan
Marco Chiani, University of Bologna, Italy
Franco Chiaraluce, Università Politecnica delle Marche, Italy
Luca Chiaraviglio, University of Rome Tor Vergata, Italy
Carla Fabiana Chiasserini, Politecnico di Torino, Italy
Feng-Tsun Chien, National Chiao Tung University, Taiwan
Wen-Long Chin, National Cheng Kung University, Taiwan
Woon Hau Chin, Toshiba Research Europe Limited, United Kingdom (Great Britain)
Sungrae Cho, Chung-Ang University, Korea
Woong Cho, Jungwon University, Korea
Ioannis Chochliouros, Hellenic Telecommunications Organization S.A. (OTE), Greece
Bong Jun Choi, Soongsil University, Korea
Wan Choi, KAIST, Korea
Junil Choi, Pohang University of Science and Technology (POSTECH), Korea
Jihwan Choi, Daegu Gyeongbuk Institute of Science and Technology, Korea
Jun Won Choi, Hanyang University, Korea
Jinho Choi, Deakin University, Australia
Ji-Woong Choi, DGIST, Korea
Piotr Cholda, AGH University of Science and Technology, Poland
Peter Han Joo Chong, Auckland University of Technology, New Zealand
Ribhu Chopra, Indian Institute of Technology Guwahati, India
Arsenia Chorti, ENSEA, France
Remi Chou, Wichita State University, USA
Chun Tung Chou, University of New South Wales, Australia
Samir Chouali, Université de Franche Comté, France
Salimur Choudhury, Lakehead University, Canada
Richard Chow, Intel, USA
Xiaoli Chu, University of Sheffield, United Kingdom (Great Britain)
Zheng Chu, University of Surrey, United Kingdom (Great Britain)
Young Jin Chun, City University of Hong Kong, Hong Kong
Yeh-Ching Chung, National Tsing Hua University, Taiwan
Antonio Cianfrani, University of Rome Sapienza, Italy
Mehmet Cintuglu, ABB Inc, USA
Stefano Cioni, European Space Agency, The Netherlands
Domenico Ciuonzo, Network Measurement and Monitoring (NM2), Naples, IT, Italy
Thomas Clausen, Ecole Polytechnique, France
Stuart Clayman, University College London (UCL), United Kingdom (Great Britain)
Bruno Clerckx, Imperial College London, United Kingdom (Great Britain)
Michele Colajanni, University of Modena and Reggio Emilia, Italy
Sinem Coleri Ergen, Koc University, Turkey
Didier Colle, IMEC - Ghent University, Belgium
Massimiliano Comisso, University of Trieste, Italy
Massimo Condoluci, Ericsson Research, Sweden
Wang Cong, Northeastern University at Qinhuangdao, P.R. China
Mauro Conti, University of Padua, Italy
Andrea Conti, ENDIF University of Ferrara, WiLAB University of Bologna, Italy
Noelia Correia, University of Algarve, Portugal

Luis Henrique Costa, Federal University of Rio de Janeiro, Brazil
Salvatore Costanzo, University Paris Est Marne-la-Vallée, France
Xavier Costa-Perez, NEC Laboratories Europe, Germany
David Coudert, Université Côte d'Azur, Inria, CNRS, I3S, France
Matthieu Coudron, UPMC, France
Marceau Coupechoux, Telecom ParisTech, France
Noel Crespi, Institut Mines-Télécom, Télécom SudParis, France
Bruno Crispo, Università di Trento, Italy
Felipe Cruz-Pérez, Cinvestav-IPN, Mexico
Fernando Cruz-Roldán, Universidad Alcalá, Spain
Felix Cuadrado, Queen Mary University of London, United Kingdom (Great Britain)
Angel Cuevas, Universidad Carlos III de Madrid, Spain
Filippo Cugini, CNIT, Italy
Kanapathippillai Cumanan, University of York, United Kingdom (Great Britain)
Marília Curado, University of Coimbra, Portugal
Daniel Benevides da Costa, Federal University of Ceara (UFC), Brazil
Ana Paula da Silva, Universidade Federal de Minas Gerais, Brazil
Luís da Silva Cruz, Instituto de Telecomunicacoes / University of Coimbra, Portugal
Ron Dabora, Ben-Gurion University, Israel
Tasos Dagiuklas, London South Bank University, United Kingdom (Great Britain)
Hayssam Dahrouj, Effat University, Canada
Haipeng Dai, Nanjing University, P.R. China
Wanyang Dai, Nanjing University, P.R. China
Haibo Dai, Nanjing University of Posts and Telecommunications, P.R. China
Linglong Dai, Tsinghua University, P.R. China
Issam Damaj, Rafik Hariri University, Lebanon
György Dán, KTH Royal Institute of Technology, Sweden
Abdulhalim Dandoush, ESME Sudria, France
Shuping Dang, King Abdullah University of Science and Technology, Saudi Arabia
Xiaoyu Dang, Nanjing University of Aeronautics and Astronautics, P.R. China
Jian Dang, Southeast University, P.R. China
Khalid Darabkh, The University of Jordan, Jordan
Davide Dardari, University of Bologna, Italy
Waltenegus Dargie, Technische Universität Dresden, Germany
Donatella Darsena, University of Napoli Parthenope, Italy
Goutam Das, IIT Kharagpur, India
Soumya Kanti Datta, EURECOM, France
Klaus David, University of Kassel, Germany
Franco Davoli, University of Genoa, Italy
Zaher Dawy, American University of Beirut, Lebanon
Swades De, Indian Institute of Technology Delhi, India
Pradipta De, Georgia Southern University, USA
André de Almeida, Federal University of Ceará, Brazil
Tomaso De Cola, German Aerospace Center (DLR), Germany
Antonio De Domenico, CEA-LETI Minatoc, France
Riccardo De Gaudenzi, European Space Agency (ESA), The Netherlands
Antonio de la Oliva, Universidad Carlos III de Madrid, Spain
Rodrigo de Lamare, Pontifical Catholic University of Rio de Janeiro, Brazil
Juan De Luna Ducoing, University of Surrey, United Kingdom (Great Britain)
Luca De Nardis, Sapienza University of Rome, Italy
Florian De Rango, University of Calabria, Italy
Mauro De Sanctis, University of Rome "Tor Vergata", Italy

Carl Debono, University of Malta, Malta
Saptarshi Debroy, City University of New York, USA
Eugen Dedu, FEMTO-ST Institute, Univ Bourgogne Franche-Comté, CNRS, France
Armin Dekorsy, University of Bremen, Germany
Panagiotis Demestichas, University of Piraeus, Greece
Luc Deneire, University Côte d'Azur, France
Jing Deng, University of North Carolina at Greensboro, USA
Yansha Deng, King's College London, United Kingdom (Great Britain)
Xianjun Deng, St. Francis Xavier University, Canada
Na Deng, Dalian University of Technology, P.R. China
Mahsa Derakhshani, Loughborough University, United Kingdom (Great Britain)
Carl Dettmann, University of Bristol, United Kingdom (Great Britain)
Chris Develder, Ghent University - imec, Belgium
Kalpana Dhaka, Indian Institute of Technology Guwahati, India
Riadh Dhaou, IRT/ENSEEIH, University of Toulouse, France
Harpreet Dhillon, Virginia Tech, USA
Boya Di, Peking University, P.R. China
Marco Di Felice, University of Bologna, Italy
Roberto Di Pietro, Hamad Bin Khalifa University, Qatar
Marco Di Renzo, Paris-Saclay University / CNRS, France
Gladys Diaz, University of Paris 13, France
Guido Dietl, University of Applied Sciences Landshut, Germany
Nikos Dimitriou, NCSR Demokritos, Greece
Ergin Dinc, University of Cambridge, United Kingdom (Great Britain)
Guoru Ding, Army Engineering University of PLA, P.R. China
Zhiguo Ding, University of Manchester, United Kingdom (Great Britain)
Haiyang Ding, School of Information and Communications, National University of Defense Technology, P.R. China
Wei Ding, Florida Polytechnic University, USA
Liqin Ding, Harbin Institute of Technology, Shenzhen, P.R. China
Ming Ding, Data 61, Australia
Rui Dinis, Faculdade de Ciências e Tecnologia, University Nova de Lisboa, Portugal
Soufiene Djahel, Manchester Metropolitan University, United Kingdom (Great Britain)
Yacine Djemaiel, Communication Networks and Security Research Lab. University of Carthage, Tunisia
Octavia Dobre, Memorial University, Canada
Kutluyıl Doğançay, University of South Australia, Australia
Aleksandar Dogandžić, Iowa State University, USA
Lara Dolecek, UCLA, USA
Jerzy Domżał, AGH University of Science and Technology, Poland
Carlos Donato, University of Antwerp - imec, IDLab Research Group, Belgium
Chao Dong, Nanjing University of Aeronautics and Astronautics, P.R. China
Ziqian (Cecilia) Dong, New York Institute of Technology, USA
Miaomiao Dong, City University of Hong Kong, Hong Kong
Yuhan Dong, Tsinghua University, P.R. China
Yanjie Dong, University of British Columbia, Vancouver, Canada
Zhicheng Dong, Tibet University, P.R. China
Xiaodai Dong, University of Victoria, Canada
Yanjie Dong, The University of British Columbia, Canada
Mianxiong Dong, Muroran Institute of Technology, Japan
Meik Dörpinghaus, TU Dresden, Germany
Ahmed Douik, California Institute of Technology, USA
Guillaume Doyen, Troyes University of Technology, France

Falko Dressler, Paderborn University, Germany
Hongwei Du, Harbin Institute of Technology Shenzhen Graduate School, P.R. China
Qinghe Du, Xi'an Jiaotong University, P.R. China
Ping Du, The University of Tokyo, Japan
Jun Du, Tsinghua University, Beijing, P.R. China
Jinfeng Du, Nokia Bell Labs, USA
Huiqin Du, Jinan University, P.R. China
Jian Du, Carnegie Mellon University, USA
Yinggang Du, Huawei Technologies Sweden AB, Sweden
Zhengfeng Du, Shandong University, P.R. China
Zhiyong Du, National University of Defence Technology, P.R. China
Zhenhai Duan, Florida State University, USA
Qiang Duan, The Pennsylvania State University, USA
Wei Duan, Nantong University, P.R. China
Lingjie Duan, Singapore University of Technology and Design (SUTD), Singapore
Ankit Dubey, National Institute of Technology Goa, India
Crockett Dudley, University of Cannonsburg, USA
Giuseppe Durisi, Chalmers University of Technology, Sweden
Salman Durrani, The Australian National University, Australia
Arjan Duresi, Indiana Un. Purdue University Indianapolis, USA
Amit Dvir, Ariel University, Israel
Vladimir Dyo, University of Bedfordshire, United Kingdom (Great Britain)
Andrew Eckford, York University, Canada
George Efthymoglou, University of Piraeus, Greece
Inès El Korbi, University of Manouba, Tunisia
Salah Eddine Elayoubi, CentraleSupélec, France
Rachid El-Azouzi, University of Avignon, France
Tamer ElBatt, Faculty of Engineering, Cairo University, Egypt
Taisir El-Gorashi, University of Leeds, United Kingdom (Great Britain)
Mohammed El-Hajjar, University of Southampton, United Kingdom (Great Britain)
Jocelyne Elias, Paris Descartes University, France
Maged Elkaashlan, Queen Mary, University of London, United Kingdom (Great Britain)
Khalil El-Khatib, University of Ontario Institute of Technology, Canada
Ehab Elmallah, University of Alberta, Canada
Amr Elmougy, University of Canada in Egypt, Egypt
Hesham ElSawy, King Fahd University of Petroleum and Minerals (KFUPM), Saudi Arabia
Mohammed Eltayeb, California State University, Sacramento, USA
Mohamed Eltoweissy, Virginia Military Institute, USA
Vincenzo Eramo, University of Rome "La Sapienza", Italy
Thomas Eriksson, Chalmers University of Technology, Sweden
Elza Erkip, New York University, USA
Serhat Erkucuk, Kadir Has University, Turkey
Melike Erol-Kantarci, University of Ottawa, Canada
Tomaso Erseghe, University of Padova, Italy
Oscar Esparza, Universitat Politècnica de Catalunya, Spain
Moez Esseghir, Technology University of Troyes, France
Inaki Estella, Huawei Technologies Co., Ltd., France
Barry Evans, University of Surrey, United Kingdom (Great Britain)
Zubair Fadlullah, Graduate School of Information Science, Tohoku University, Japan
Xenofon Fafoutis, Technical University of Denmark, Denmark
Yasir Faheem, COMSATS Institute of Information Technology, Pakistan
Ilhem Fajjari, Orange labs, France

Mikael Fallgren, Ericsson Research, Sweden
Lisheng Fan, Guangzhou University, P.R. China

Abstract— Online card transaction fraud is one of the major threats to the bottom line of E-commerce merchants. In this paper, we propose a novel method for online merchants to utilize disposable (“one-time use”) domain names to detect client IP spoofing by collecting client’s DNS information during an E-commerce transaction, which in turn can help with transaction fraud detection. By inserting a dynamically generated unique hostname on the E-commerce transaction webpage, a client will issue an identifiable DNS query to the customized authoritative DNS server maintained by the online Merchant. In this way, the online Merchant is able to collect DNS configuration of the client and match it with the client’s corresponding transaction in order to verify the consistency of the client’s IP address. Any discrepancy can reveal proxy usage, which fraudsters commonly use to spoof their true origins. We have deployed our preliminary prototype system on a real online merchant and successfully collected clients DNS queries correlated with their web transactions; then we show some real instances of successful fraud detection using this method. We also address some concerns regarding the use of disposable domains.

Keywords—*Electronic Commerce; fraud detection; Disposable Domain Name; DNS; Authoritative Name Server; Proxy Detection; Security*

I. INTRODUCTION

Establishing the integrity of client’s IP address has a crucial security implication. This is especially true in the E-commerce environment, where many fraud detection methods, such as velocity checks [1], rely on client reporting its true IP address. On the other hand, many freely available tools allow clients to easily conceal their true IP addresses [2]. Online transaction fraudsters will often utilize these tools (such as proxy or VPN) to circumvent the velocity checks mentioned above. Thus, being able to verify the integrity of client’s IP address is important in detecting fraudulent transaction attempts. Furthermore, it could also benefit other security applications as well (e.g., remote user login, geolocation-based access control, etc.).

In this paper, we propose a novel method for detecting IP address tampering in online card transactions by examining the DNS configuration of the client’s machine using disposable domain names. It begins with inserting a uniquely generated “one-time use” hostname on the Merchant’s webpage. This force the client to issue a DNS query for that hostname to its local DNS server, which will propagate to the Merchant’s authoritative name server. The server can then match this query with the correct transaction for further analysis. For more information on DNS protocol and the various servers involved in its operation, please refer to [3][4].

To obtain real E-commerce transaction dataset and test the proposed system in practical environment, we collaborate with an E-commerce company that allows us to install our code on their production website and their authoritative DNS server for several months; the resulting dataset is used as the basis of our analysis. Since this is a real life E-commerce server, we are able to collect data from tens of thousands of transactions from thousands of client devices across hundreds of countries. The dataset also contains interesting observation on the prevalence and utilization statistics of public DNS servers, such as Google DNS or OpenDNS [5].

The structure of this paper is as follows: In the next section, we provide previous related works before modeling the adversary and the details of our approach in Section III. Next, Section IV shows the real life dataset that we collected from our E-commerce Merchant partner. Section V discusses various results we found from the dataset and our effort to address the concerns regarding the use of disposable domains. Finally, Section VI concludes the paper.

II. RELATED WORK

A. Fraudulent Transactions Detection methods

A vast body of literature has proposed various methods for collecting and identifying data and information of a website’s client devices using various methods. Later analysis of this so-called fingerprinting information can detect anomalies commonly associated with fraud [6]. In general, there are two types of fingerprinting methods: active and passive fingerprints. An active fingerprinting acquires information by sending probes deliberately, while on the other hand, a passive fingerprinting obtains information by sniffing and monitoring traffic data silently even without making the targeted systems aware. In this sense, our proposed approach is more similar to passive fingerprinting as it can collect data non-obtrusively.

In [7], the author used DNS analysis techniques to detect domains that were engaged in malicious activities. The paper proposes extracting a large number of features from DNS traffic to detect wide variety of malicious domains automatically, which include activities such as botnet commands, phishing and scamming.

Authors in [8] introduced operating system (OS) fingerprinting based on DNS query characterization. Their paper showed that a specific OS sent queries with specific time-interval patterns. Hence, analysis of DNS queries received by DNS name servers can reveal information about the OS of the DNS resolver that sent these queries.

Meanwhile, papers in [9] and [10] use the client's DNS activities to obtain behavioral. By exploiting DNS queries of particular users, the work in [9] reveals that it can detect the presence of an anonymized user in a new DNS stream with high accuracy based on the user's historical DNS activities. Similarly, the work in [10] attempted to capture the profile of users who had dynamic IP addresses by employing some pattern mining techniques to the DNS traffic.

As for checking the integrity of reported IP address, authors in [11] explore several proxy detection techniques to prevent fraudulent activities in real e-commerce services. The paper at the same time proposed a detection method based on the previous knowledge of cyber criminals who had gained access to the system and performed preventive action before the cyber criminals commit fraud.

There is also a well-established standard for protecting the integrity of DNS protocol itself, which is called DNS Security (DNSSEC) and is specified by Internet Engineering Task Force (IETF) in [12]. However, it is designed to protect against attempts to hijack the protocol to redirect traffic to deceptive websites and does not address fraudulent client activities.

B. Disposable domain names usage

Most papers viewed disposable/one-time domain names as a misuse of DNS protocol. The literatures viewed this misuse as either malicious (such as botnet command and control [13] or NXDOMAIN hijacking [14]), or somewhat benign (performance improvement [15] [16], analytics and file reputation queries [17]). The objective of the papers itself are mostly on the detection of the misuse [18] and mitigating its impact on the various component of DNS protocol, in particular the DNS name servers [19].

C. Evaluation of the previous works

All of the above-mentioned existing works on fraud detection put emphasis on capturing the DNS traffic using the ISP's DNS Resolver as this server directly communicates with the client and therefore the client's data is more readily available. As a result, e-commerce merchants cannot use this approach because they are simply content providers and do not own or control the ISP used by the client. Our work, on the other hand, allows content providers to obtain the client's DNS configuration without any help from any ISP or intermediaries.

More importantly, compared to other proxy detection techniques, our work can directly correlate a DNS Query with its web session/transaction using simple static HTML image tag, which is impervious to most script manipulation, such as script editing [20] or JavaScript disabling [21]. Of course, a determined fraudster could attempt to block *any* image download from a webpage. However, such action will clearly raise the flag further as every single transaction has its own tracking and any missing DNS Query for a transaction can be easily detected and flagged as suspicious.

Concerning existing works on disposable domain names, our proposal is unique because it utilizes DNS protocol as a fraud detection method. Furthermore, our work also attempts to mitigate its on DNS infrastructure by minimizing traffic and reducing its cache burden.

III. DNS CONFIGURATION PROFILING

A. Adversary Model

In this paper, the online merchant wants to detect if the IP address of the client is real or if there is indication of manipulation attempt to conceal the real IP address using proxy or similar technology.

Some specific characteristics of these concealment attempts are important for our model:

- The fraudsters behind this will want to monetize a stolen card as soon as possible – prior to the issuer blocking the card. As such, fraudsters must conduct fraudulent transactions within a short time period. This is the basis of the *velocity check* commonly performed by rule-based detection methods [1]. At its core, a velocity check detects if the same person (i.e., same email, same IP address, etc.) made numerous purchases within a short timeframe.
- To defeat velocity detection, fraudsters will attempt to conceal their IP addresses [22]. Nevertheless, they must perform this efficiently, due to the time constraints mentioned above. They might use freely available proxy, or use VPN Provider. However, it is very unlikely that they will install their own proxy or VPN server at a remote location. Hence, they will have very limited or no control at the entire proxy server [2] they utilize, including its DNS configuration.
- Another reason for an online fraudster to hide his real IP address is to deceive the merchant into thinking that the client's physical location is within the same geographical location as the stolen payment card's billing address. This is a security feature of the credit/debit card known as Address Verification System (AVS) [23]. As North America and Europe issue the majority of stolen credit/debit cards [24], most fraudsters will attempt to masquerade themselves as coming from these regions too, and hence we should focus our proxy IP addresses and detection attempt in these regions as well.

In summary, we want to analyze if there are any patterns of IP manipulation that we can discover by looking at the DNS configurations of suspicious transactions with IP addresses that are located in North America or Europe. We believe DNS configuration can help reveal these patterns and hence complement and enhance existing fraud detection methods.

B. Client DNS Configuration Data Gathering Methodology

To obtain client DNS configuration, we want to be able to:

1. **Make the client perform DNS query to E-commerce Merchant's own authoritative name server.** Forcing the client to perform DNS query seems very straightforward, as every client will need resolve the name of the hosts present in the webpages into their IP addresses. However, for efficiency DNS clients and local DNS servers have caching mechanism, which could prevent many DNS queries from going directly to the corresponding authoritative name servers [25]. In order to guarantee that checkout webpage for every online financial transaction will generate a DNS query that can be received and uniquely identified by the

online Merchant’s authoritative name server, the Merchant webserver *dynamically generates a unique hostname* and embeds it as an HTML asset. In this way, the client’s web browser will always have to resolve it from the authoritative name server since this unique hostname has never been resolved and cached in local DNS servers.

2. **Associate the DNS query with the transaction/session that generates that query.** In order to match the query with the transaction, we must embed the data into the DNS query message itself. Unfortunately, the only field on the message that a webpage or webserver can control is the hostname that is used to reference an HTML asset (i.e., image, css, etc.). Hence, we must embed the transaction id into the hostname so this identifier will propagate back into our authoritative name server, which the server will match with the corresponding transaction.

In order to successfully implement this technique, we need to update and construct two components:

- **A webpage containing an asset (i.e., image, css, etc.) referenced with the unique hostname.** A server-side or client-side scripting can generate the hostname. Server-side is more secure but it might not be practical for websites that uses static pages. Client-side scripting is less secure, but we can use obfuscation techniques to hide the script and the hostname to hinder their tampering. Merchants can put this page anywhere in the checkout process of an online credit/debit card transaction.
- **A custom-made DNS authoritative name server.** As every single transaction will generate a unique hostname, we need custom-made DNS authoritative name servers that will answer/respond to all hostname queries. These servers will answer all hostname queries that follow our format and encoding. Furthermore, they will also parse the hostname to recover the transaction ID and update our transaction database with the DNS query that it receives.

Figure 1 illustrates the diagram of this proposed technique.

Fig. 1. The process of obtaining client’s DNS configuration using disposable domain. By embedding the client’s transaction ID into the dynamically-generated unique hostname, the online Merchant can correlate client IP with its DNS Resolver.

C. Method Implementation

Since we are deploying our technique on a merchant server that runs live transaction, we have to ensure compatibility with the merchant’s current system. The merchant uses static pages hosted on Amazon’s Content Delivery Network for its E-commerce website. However, the checkout page itself is using Amazon’s Cloud Compute, hence we choose to use server-side scripting (PHP) to generate the unique hostname. We obtain the final hostname by combining two-character random salt with the 10-digit transaction id, encrypting them with simple PHP **mcrypt** function and converting the result to hexadecimal representation. This is not the most efficient use of character space, but some DNS servers randomize the capitalization of hostname and do not support special characters. Therefore, to ensure robust transmission of hostname, we choose hexadecimal representation. The final html tag on the webpage will look like this:

```
<img src='https://a1b2c3d4.subdom.mybiz.com/a.gif'>
```

For coding the custom-made authoritative name server, we modify the freely available PHP DNS server [26]. Although PHP is not the most efficient language for implementing DNS server, our collaborative Merchant uses PHP/MySQL for their transaction processing, so by also using PHP we can ensure compatibility with their existing transaction database access. It is also easy to recover the transaction ID back from the hostname as we simply reverse the process using similar PHP functions. Furthermore, their transaction activity is light – hence there is no requirement for high performance DNS authoritative name server. We configure the name server so it responds only to queries that follow our format. This security measure is necessary as our server receives malicious DNS queries within *minutes* of coming online.

To facilitate system deployment, and impose minimum change to an online Merchant’s existing E-commerce system, the customized authoritative name server will be an added component without touching the original authoritative name server of an online Merchant. To achieve this goal, we add a subdomain record in the Merchant’s DNS zone so that our special name server will act as the name server only for all name queries in the specified subdomain. For example, suppose the Merchant domain name is mybiz.com, and the subdomain for our DNS profiling is subdom.mybiz.com, then our customized authoritative name server will respond to all hostname queries in that subdomain (i.e., *.subdom.mybiz.com).

D. Benefits Provided by the DNS Configuration Profiling

Our method offers several advantages compared to existing fingerprinting/tracking/proxy detection techniques:

- Fraudsters cannot disable or modify this tracking. The tracking hostname can host real asset needed by the webpage (image, stylesheet, etc.), so disabling it means rendering the webpage non-functional, which can be easily detected and marked as suspicious. In comparison, JavaScript-based tracking code, such as the methods proposed in [27], is prone to modification or deactivation. Our dataset supports this assessment, as we are able to obtain and correlate DNS data for 100% of our transactions.

- It is difficult or impossible for fraudsters to manipulate the data, as modification requires direct control of the proxy server, which is seldom possible. Furthermore, *any* modification must be consistent with data collected for *all* other users of the same proxy server or even servers on the same subnet, otherwise we consider the discrepancies as suspicious.
- For caching, security monitoring, or even censorship purposes, numerous network devices in the path from a client to its used proxy server can perform their own *additional* DNS Query for all hostnames that pass through their system [28] [29]. For example, some ISPs, even WiFi Routers, autonomously send DNS Query for unknown hostnames contained in the network traffic passing through them. If this happens, the authoritative name server in our system will receive multiple DNS queries for the same hostname, matching to a single online card transaction. These additional queries will inadvertently disclose the Client's real location or at least part of its network path to the proxy.
- Finally, our method only runs codes on the Merchant's own server and does not require any coordination and cooperation from other parties. Online merchant can deploy this independently as it leverages Merchant's existing infrastructure and, assuming the Merchant already run its own authoritative name server, it does not incur any additional cost.

IV. DATASET EVALUATION

To obtain real E-commerce transaction dataset and test the proposed system in practical environment, we collaborate with an E-commerce company that allows us to install our code on their production website and, as we don't want to disrupt its existing authoritative DNS, an additional authoritative DNS server. We deployed our code on the Merchant's server from November 2017 until March 2018. During that time, we collected DNS data from 18,974 transactions.

In addition, since we want to analyze abnormalities in DNS queries originated from the same IP or IPs within the same subnet, we group together transactions based on the subnet of their reported IP addresses. In order to simplify our analysis, we assume a class C (/24) subnet. Next, we write a script to report subnets where the majority (> 75%) of all transactions of that subnet is considered suspicious or fraudulent, as reported by our merchant's fraud team. We choose lower threshold than 100% because we assume that our Merchant could have missed detecting some fraudulent cases. Finally, we manually look at each of these reported subnets and analyze the DNS address patterns that we saw.

In order to obtain the geolocation and organization of a client IP address, we use freely available web tools such as `iplocator.net`.

As mentioned earlier, our DNS data gathering method is very robust as we got 100% of the transactions correlated with their DNS data. In other words, no transaction failed to report its client's DNS configuration. In comparison, JavaScript fingerprinting code [27] has up to 5% failure in collecting data

on the same transactions dataset. This is because disabling JavaScript is easier and often does not break the webpage; it is also commonly existed for some legitimate users. Whereas disabling image, etc. to disable our proposed DNS data gathering will usually render the webpage unusable.

A. Normal DNS Behavior

There are two types of DNS queries: iterative and recursive. *Iterative* queries will be resolved without querying other DNS servers, even if it means the answer is not definitive. *Recursive* queries will attempt to query other DNS servers until it obtains a definitive answer.

Common desktop and mobile Operating System, such as Windows, Android or Apple's IOS, runs a simplified DNS Resolver called stub resolver [3]. This minimal resolver might contain caching functionality but it depends on its ISP's DNS server to resolve unknown hostname and will use recursive query to do so. The ISP's DNS servers are the ones that send DNS queries to our customized authoritative name server and their configuration is the one that we record. Therefore, clients from the same ISP (same subnet) will usually share the same one or two local DNS Server address, all of which belongs to the same organization/ISP. For example, client with IP address 73.21.251.160 (Geolocation: US, ISP: Comcast) has DNS Server address of 69.252.68.139 (Geolocation: US, ISP: Comcast).

However, after looking at both the transactions and their corresponding DNS Resolver addresses for high-risk subnets, we could identify several anomalies in their DNS configuration.

B. Identical IP and DNS Address

A transaction from these subnets has the same address for both its IP address and its DNS Resolver address. This means that the same device has a fully functioning DNS Resolver. However, since ordinary buyer's device should only have a stub resolver [3], it means that the device used here is not a common desktop/mobile device, but potentially a server itself: it probably runs a proxy service – including DNS Server. Table 1 shows several examples belonging to this abnormal category.

IP = DNS	
Client IP	DNS
108.62.5.130	108.62.5.130
108.62.5.36	108.62.5.36
38.132.120.66	38.132.120.66
173.239.240.159	173.239.240.159
185.153.176.2	185.153.176.2

Table 1. Sample list of transactions where the DNS Resolver IP address is the same as the client's IP address

C. DNS Geolocation Differs from Client's IP

The DNS Resolver from these transactions is located on a different country from where the corresponding client IP is, which clearly is abnormal since a legitimate client's own ISP usually has its DNS Servers located nearby to speed up the name resolving process. The reasonable explanation for this abnormal behavior is that the client is hiding his IP address by using proxy and his ISP (or in some cases, the client's home router) is intercepting the packet destined to the proxy and performing its

own DNS query. When this happens, the extraneous query pierces the confidentiality of the proxy and reveals the client's true location to us.

We show sample transactions belonging to this category in Table 2. In the Indonesian and Turkey DNS server case, we investigated it further and found that Indonesian and Turkey ISPs resolved unknown hostname automatically as part of their traffic monitoring and censorship actions [28] [29].

This explanation does not work in the other direction, as it is common for high-risk country devices to use American or other public DNS server to avoid their country's Internet censorship.

IP Geo $\neq$ DNS Geo			
Client IP	IP Geo	DNS	DNS Geo
77.234.46.224	USA	178.18.201.113	Turkey
77.234.46.194	USA	202.152.254.245	Indonesia
138.197.174.117	Canada	180.251.20.148	Indonesia
138.197.174.154	Canada	41.226.16.50	Tunisia

Table 2. Sample list of transactions where the DNS Resolver geolocation is from a high-risk country that differs from the corresponding client's IP geolocation

D. Various DNS Resolvers in the Same Subnet

In this case, we found subnets where clients that have IP addresses in close proximity (sometimes even contiguous) use numerous different DNS Resolvers and these Resolvers come from different organizations. Obviously, this does not make sense. In a normal situation, clients DNS configuration comes from their ISP, so IP addresses from the same subnet from the same ISP should have the same DNS configuration. However, if the client is hiding its IP address and is using HTTP-only proxy [30], for example, the client IP observed by online Merchant will be the IP of the proxy. In such a scenario, the DNS Resolver of the same IP or same subnet could be totally different as the proxy could be used by many different clients that are originated from different ISPs, each with its own DNS configuration. Table 3 shows several transaction examples belonging to this category.

This also shows our method's strength against tampering. A fraudster might change his DNS configuration to try to match his proxy persona. However, he won't be able to change the configuration of other user in the same subnet, and hence this inconsistency will reveal his manipulation attempt.

Same Client IP subnet, too many different DNS subnet		
Client IP	DNS	DNS Org
172.98.87.112	86.51.29.38	Bayanat Al-Oula
172.98.87.113	37.107.255.149	SaudiNet
172.98.87.223	216.87.131.212	Verisign
172.98.87.246	66.249.84.58	Google

Table 3. Sample list of transactions where clients from the same subnet (172.98.87.0/24) use DNS Resolvers from many different organizations

E. Sharing Subnets between IP Address and DNS Server

In this case, many clients' IP addresses are located within the same subnet as their DNS server farm. The presence of numerous DNS servers on the same subnet is not abnormal, as this might simply be an indication of a DNS farm for load balancing. However, it also means that other addresses in the same subnet are servers as well, as it is very insecure (and

therefore very unlikely) for ISPs to have clients and public servers sharing the same subnet [31]. Hence, client transactions that use this subnet are suspicious as it is very likely that they originate from servers (i.e., proxy) and not from a real client machine. Table 4 shows several transaction examples belonging to this category.

Client IPs in the same subnet with DNS farm	
Client IP	DNS
5.62.59.11	5.62.59.212
5.62.59.13	5.62.59.194
5.62.59.17	5.62.59.195
5.62.59.21	5.62.59.196
5.62.59.26	5.62.59.197
5.62.59.29	5.62.59.198
5.62.59.37	5.62.59.200
5.62.59.45	5.62.59.203

Table 4. Sample list of transactions where clients uses identical subnet for both IP address and DNS server farm (5.62.59.X)

F. Summary: comparison to other fraud detection methods

We summarize our findings below. As the usage of disposable domain names is meant to supplement existing fraud detection methods but not to replace them, we are only interested in precision (true positive fraction of all suspected transactions) and not recall. We use the Merchant's existing fraud detection result as the ground truth.

Type	Precision	Nbr of txn
IP = DNS	100%	34
IP Geo $\neq$ DNS Geo	28.18%	1,661
Same subnet, different DNS	97.82%	275
IP/DNS share subnet	100%	208

Table 5. Precision of disposable domain method in detecting fraud

The disposable domain names method shows a high degree of precision, except for the case of difference in geolocation between the client's IP and its DNS. However, as mentioned previously, there are legitimate reasons to use different DNS than the one allocated by the client's ISP. Hence, the majority of these cases are benign and it shows in the result.

G. General Observation on Third-party DNS

Out of the 18,974 transactions collected in our dataset, there are 1,661 (8.7%) that use third-party (i.e., the DNS IP address is registered to entity other than the client's ISP). We grouped the entities that own these DNS servers and figure 2 shows the result.

The vast majority of these DNS are well-known public DNS servers: Google and OpenDNS [32] [33]. Together, they count for more than 80% of the data. The remaining third parties are not too well known, with some of them actually come from suspicious transactions mentioned earlier.

Fig. 2. The statistics of third party DNS server usage by entity.

As Google is by far the largest entity, we further analyze Google DNS data by looking into geolocation, as shown in figure 3.

Fig. 3. Google public DNS geolocation referenced by ISO country code.

As mentioned in the overview of their public DNS server [34], Google DNS host its data centers worldwide, and it uses anycast routing to send users to the geographically closest data center [35]. As the majority of our collaborative Merchant's customers originate from North America, Europe and South America, the statistics reflects this by showing that the majority of Google DNS' geolocation is from US, Belgium and Chile, respectively.

H. Access Time on Client's Browser

We measure the impact of our additional DNS lookup from various locations in the world as shown in Table 6. USA location has the best time since the name server is located in Virginia. However, even in the worst case, the impact to customer's experience is minimal.

US	Asia	Europe	South America
57.30	282.6	142.4	248.6

Table 6. Average access time from around the world (ms)

V. DISCUSSION

A. Broader usage

Although our focus is on analyzing DNS profile for suspicious online debit/credit card transactions, it is also applicable to other applications where integrity of client's IP address is crucial. Several contemporary examples are

geolocation-restricted content from streaming service such as Netflix, or even simple remote user web login that has geolocation-based restriction.

As our approach uses domain owner / content provider's own web / authoritative name server and therefore does not incur additional costs, it can be deployed even in the most mundane applications. In fact, we can use it on any web interaction that has a session associated with it. We believe this proposed method has the potential of greatly increasing the security of website interaction and Internet in general.

B. Limitation

Although our approach is successful in using DNS data to detect IP spoofing activity, sometime a client has a legitimate reason to hide its identity, as in the case to circumvent monitoring and censorship by its local government. Fortunately, most frauds originate from IP addresses that purport to come from developed countries – as this is where most of the stolen cards originated from – hence we can focus on these countries instead [24].

Another observation is that we can achieve 100% data-gathering rate. We believe this is because our DNS profiling method is new and therefore the fraudsters do not expect this and thus have not implemented any countermeasures. Nevertheless, if a webpage asset download is disabled, we can resort to incorporate our profiling hostname into the checkout server hostname itself. That is, we make unique payment server hostname for every single transaction, for example: <https://a1b2c3.payment.mybiz.com>. However, the downside is that we must use SSL wildcard certificate and we cannot use the more secure SSL Extended Validation (EV) certificate [36]. This is because EV certificate must associate with only one domain name and it does not work for multiple domain names such as in wildcard certificate.

C. Public DNS Proliferation

There is a possibility that ISPs might start relegating their DNS service to Google or other public DNS for cost-saving reason. Although it seems that this would render our method ineffective, in reality it would just reduce our accuracy as Google, for example, would have to increase their geographic coverage and we would still be able to get some geolocation data albeit with lower precision.

More importantly, however, is that Google DNS recently supports EDNS Client Subnet (ECS) [37], which is a DNS extension that provides client subnet as part of the query [38]. This is even better from our profiling perspective, as we will be able to directly obtain the source address of the client that initiates the DNS query. This is an interesting development and we plan to perform further research in this area.

D. Reducing burden on DNS Protocol

We implement several techniques to reduce the impact of our approach to the DNS protocol and its components. First, to reduce the impact on DNS resolver, we use small TTL value (30 seconds) and we only use second level subdomains as our unique hostname. Furthermore, we only implement our code on the checkout page, which means each transaction only generates one extra DNS request.

VI. CONCLUSION

In this paper, we have shown how a carefully crafted webpage asset reveals client's DNS configuration, which in turn helps detect IP concealment attempt commonly associated with online fraud. By analyzing the dataset collected from a real online Merchant, we show how analysis of DNS profile can reveal various IP concealment attempts. Furthermore, we demonstrate how our approach is robust and difficult to tamper with. Finally, we show several statistics for public DNS servers based on our collected dataset, and how we can still utilize our method even under this circumstance.
