Background

The case of flooding in Indonesia is caused by the blockage of water channels that piled by wasted which block the flow of water and causing flood during rainy season. The reason for the obstruction to water flow is because people still throw rubbish into water channels, resulting and causing obstruction of water flow. Therefore efforts are needed to reduce the impact of clogged waste in waterways.

Goal

This aims to provide education about the importance of information on the impact of waste, especially on waterways to children at age 6-8 years.

So that it can reduce the impact of disasters (floods) on water channels caused by waste from communities living nearby.
